Highlights Review conducted of RE mineral beneficiation using English and Chinese language sources. Of the 250 known RE minerals only bastnaesite, monazite and xenotime are extracted commercially. Flotation, using fatty acids or hydroxamates, is the primary separation process for RE minerals. Currently, optimal beneficiation processes employ flotation, gravity and magnetic separation. The most widely used chemical precipitation technique is hydroxide precipitation due to its relative simplicity, low cost and ease of pH control (Huisman et al., 2006). The solubilities of the various metal hydroxides are minimized in the pH range of 8.0–11.0.

Antimony is a member of group 15 of the periodic table, one of the elements called pnictogens, and has an electronegativity of 2.05. In accordance with periodic trends, it is more electronegative than tin or bismuth, and less electronegative than tellurium or arsenic. Antimony is stable in air at room temperature, but reacts with oxygen if heated to produce antimony trioxide, Sb_2O_3 .
